

## Harnser on the Move as Hoist Sales Rise

As sales of the Eazi Lifter - a portable hoist for quickly and safely lifting windows into upper floors - take off, the company behind the device has moved to new headquarters in East Anglia, closer to its manufacturing base.

Harnser Systems Ltd, together with its distributor Eazi Lift, has moved from the West Midlands base to a new office and workshop at the prestigious Hethel Engineering Centre in Norfolk.

The move brings the business closer to home for Jeff Crowder (pictured), who invented the Eazi Lifter window hoist which has won acclaim from installers, specifiers and health and safety specialist alike, since its launch last year.

The hoist is the first in a range of lifting devices to be launched by Harnser Systems and is manufactured in Norfolk. The team has now also set up a service centre to ensure that all devices are effectively and safely maintained.

'The Eazi Lifter makes a major contribution to improved productivity and safety within the installation industry, enabling operatives to lift and install even glazed windows, quickly and effortlessly without breaching the newly introduced Work at Height regulations,' explains Jeff Crowder.

'But it is vital that units are properly maintained, and that is a responsibility we take very seriously.'

Available via outright purchase or under contract hire arrangements, the company commits to servicing Eazi Lifter hoists six-monthly, to keep them in optimum condition.

The Eazi Lifter which sits in the window reveal allows installers, even working alone to lift both frames and glazing separately or fully assembled windows of up to 100kgs to openings three storeys high.
